

GREEN BENEFITS

Green Benefits

These days, almost everyone wants to “Be Green and Save Green” - that is, to become more environmentally responsible, hopefully without breaking the bank. LED Lighting is a great way to do just that! LED Lighting provides beautiful lighting, dramatically reduces energy usage, and because it contains no harmful materials, it helps keep our environment clean.

While LED Lighting costs more than traditional bulbs and fixtures, the long life and reduced energy usage means you'll save lots of money in the long run. And you'll be helping to save the environment from the moment you switch to LED Lighting.

Here are some of the benefits you'll realize:

- LED products save energy - up to 50% vs. conventional lighting. This reduces your electric bills and the carbon footprint.
- You get a rapid return on your investment in LED Lighting - payback can be as little as three months!
- LEDs last much longer than regular bulbs - typically 50,000 hours. That's about five and a half years of operation, 24 hours a day, 7 days a week!
- LED bulbs don't burn out the way traditional light bulbs or fluorescent tubes do. At the end of their rated life (typically 50,000 hours of use), they will still be 70% as bright as the day they were installed.
- LED products generate far less heat than traditional lighting. This helps save on cooling costs for homes and businesses.
- It's almost impossible to break an LED light bulb. LED Lighting is more durable than other lighting because LEDs don't use any glass, and have solid state components that are difficult to damage through external shock.
- LED Lighting has a low environmental impact because they do not contain mercury. This helps reduce the amount of mercury in our landfills and water and it also means there are no special disposal instructions. This helps keep us all safer.
